

LMETGE

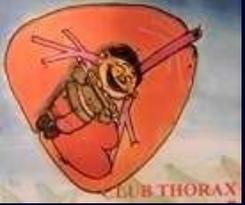

H, 64ans

Douleur du bras → hémangio endothéliome épithélioïde

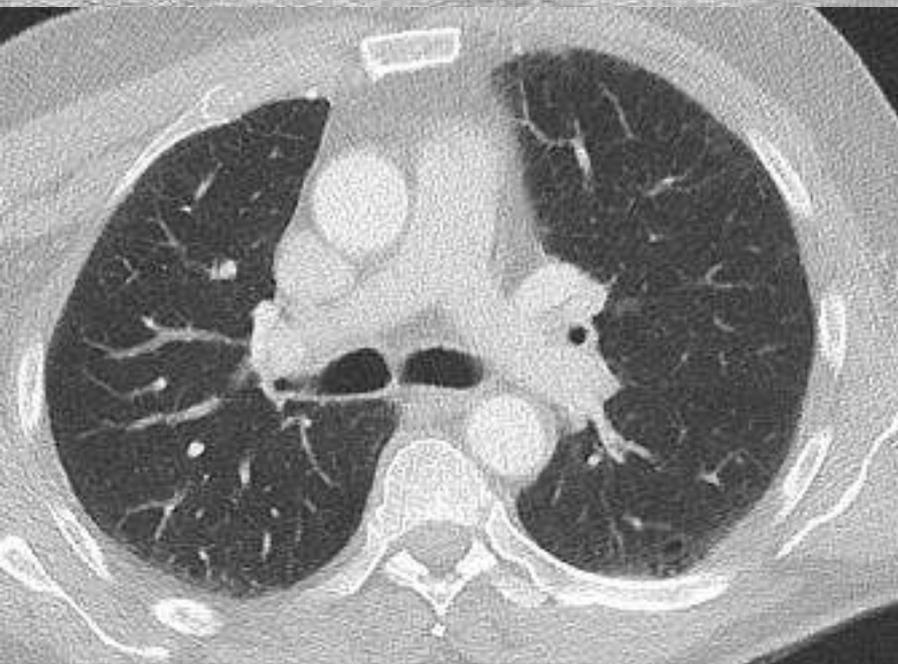

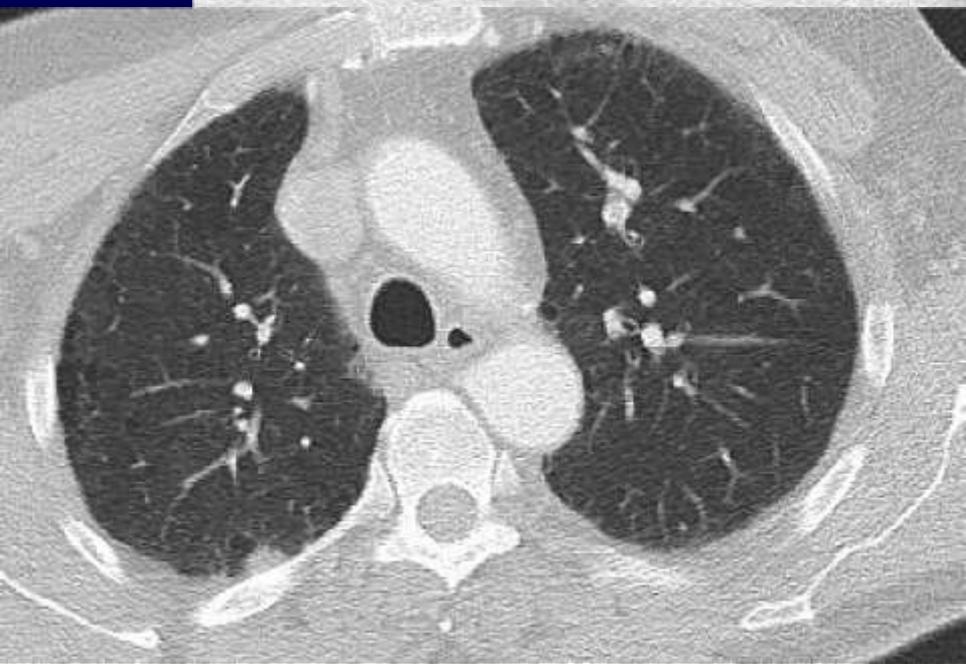

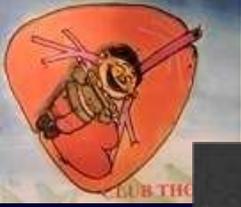

Tabagique 20p-A

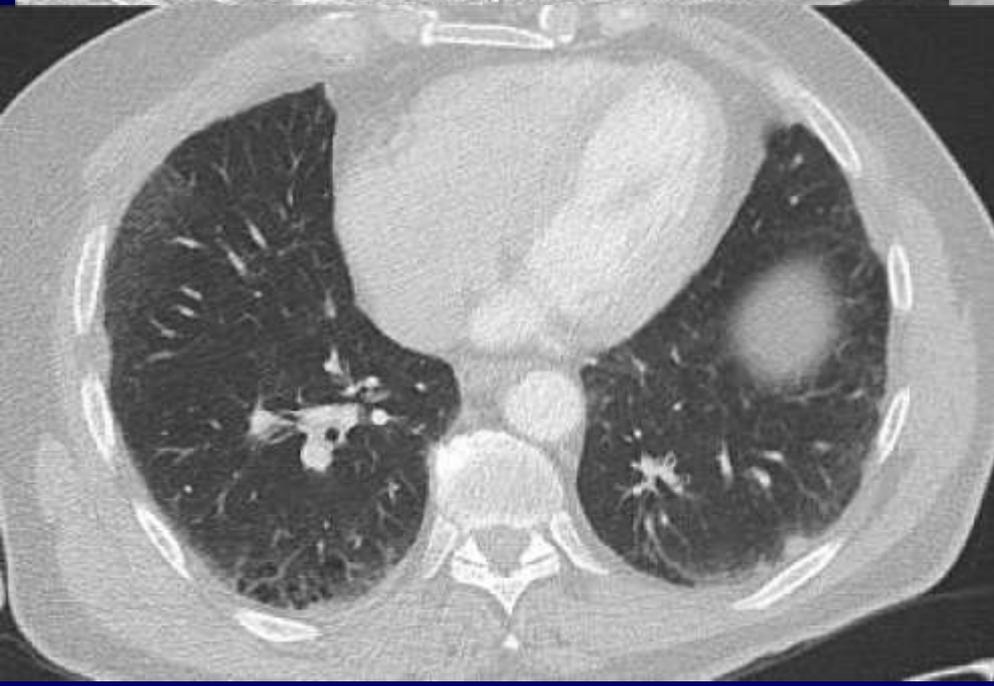

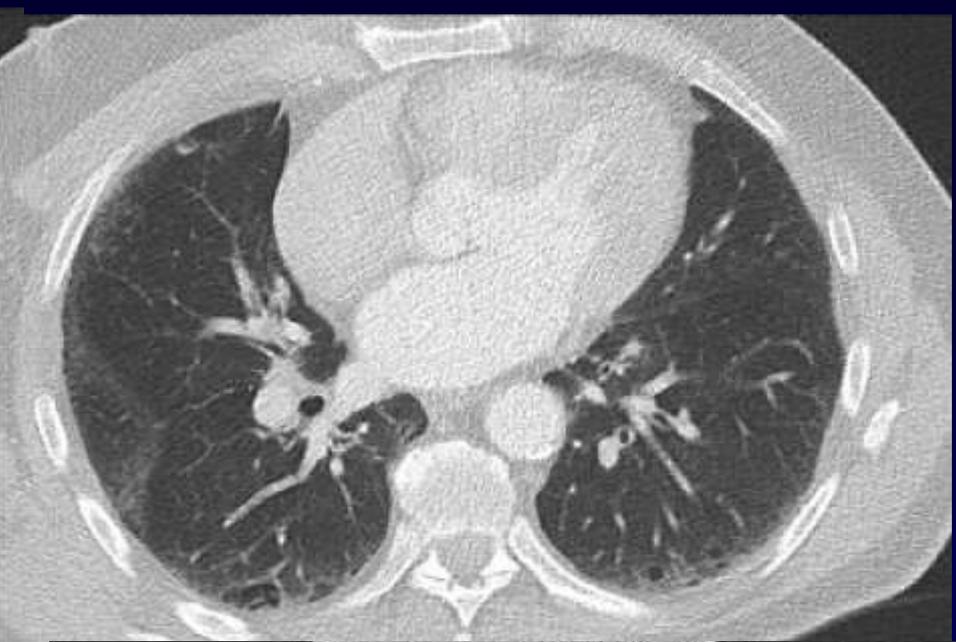

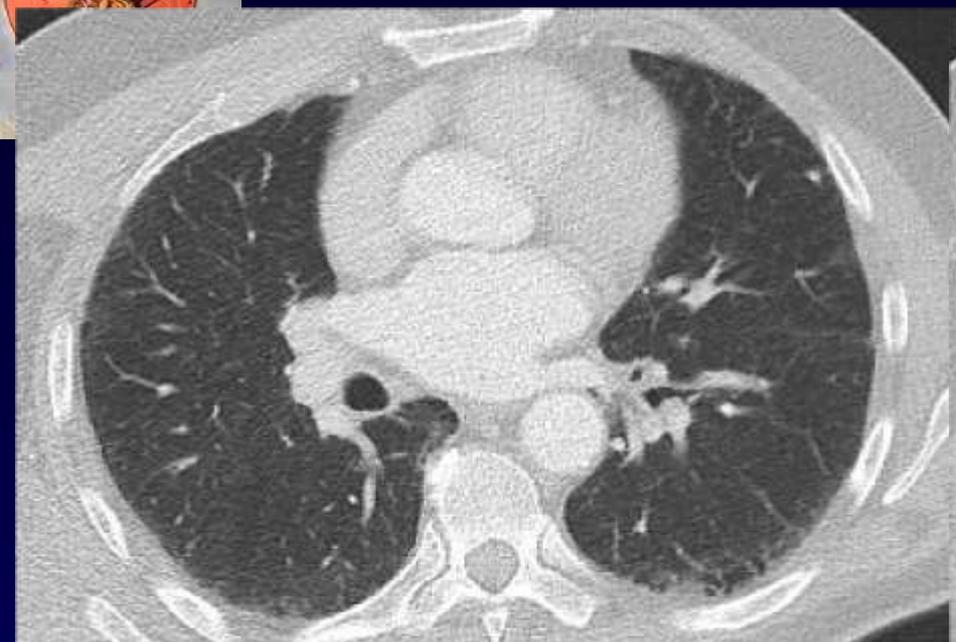

Bronchite chronique

Hippocratismes digital

2012

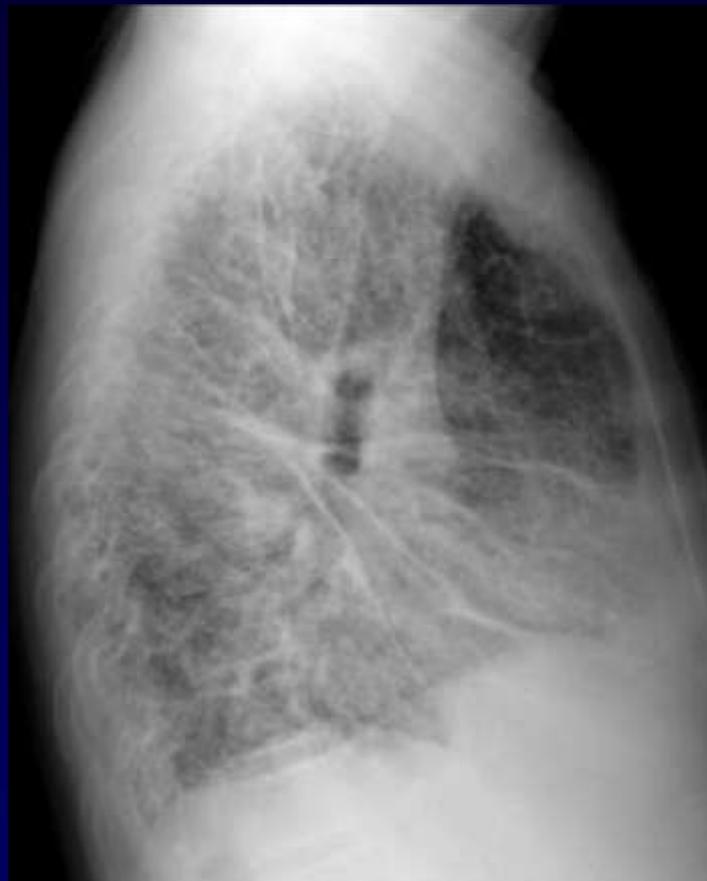

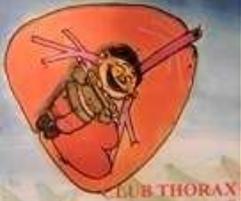

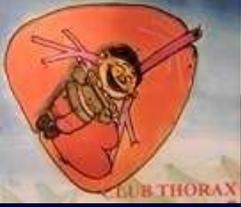

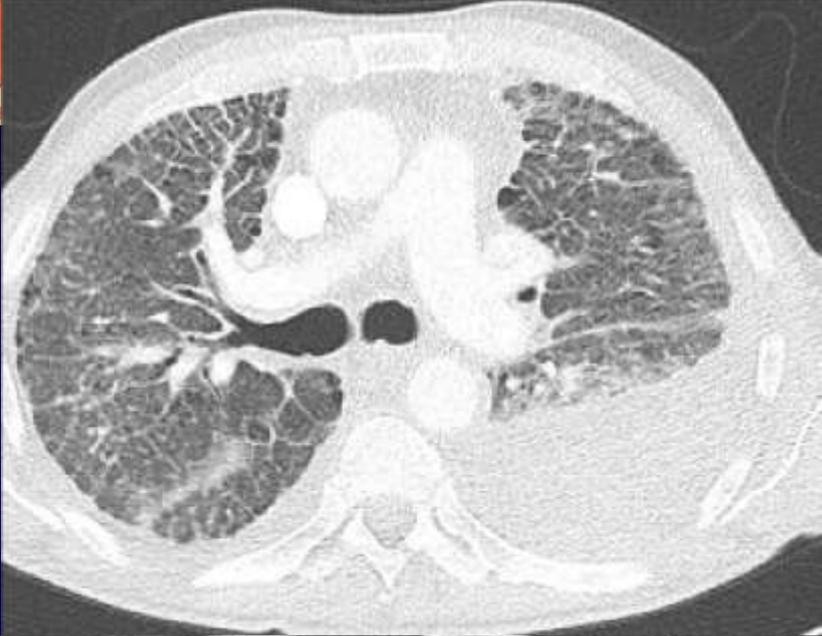

Douleurs

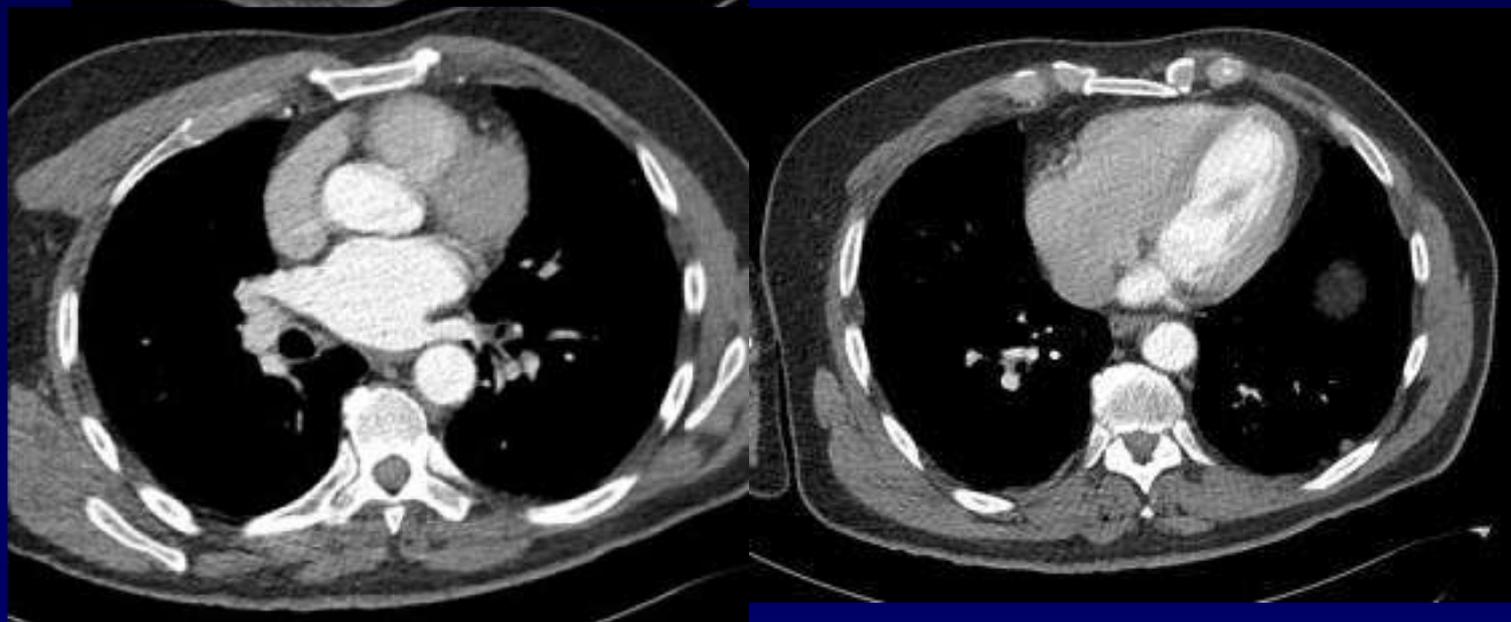

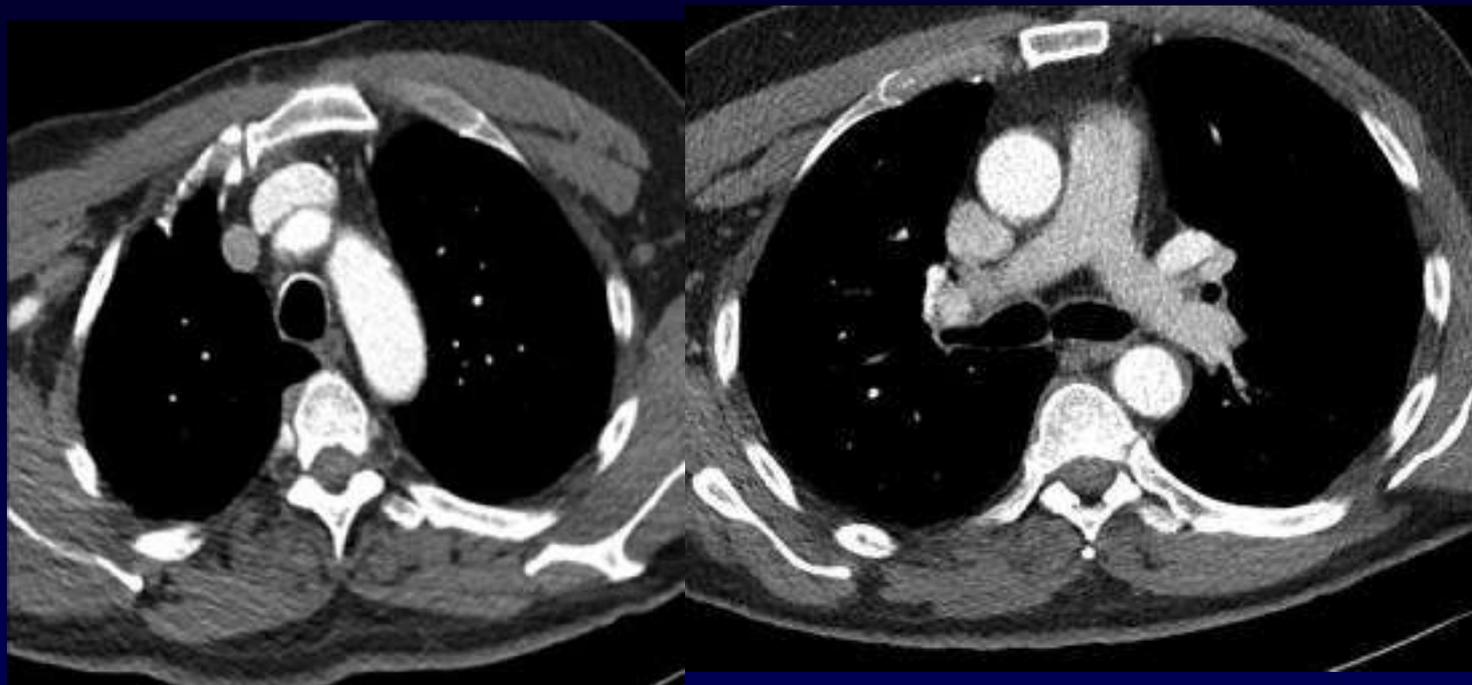

Scintigraphie : Hyper fixation osseuse bilatérale

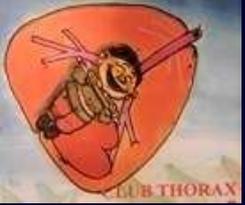

Dyspnée progressivement croissante Jan15

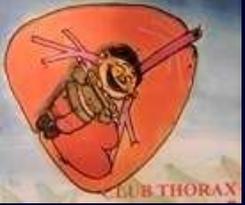

Diagnostic ?

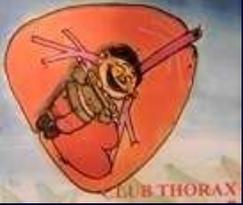

Diagnostic ?

Biopsie pulmonaire chirurgicale

Diagnostic :

Maladie d'Erdheim-Chester Histiocytose

Evolution-Discussion-Point fort

Maladie rare

Présentations cliniques variables

(douleurs osseuses ++) condensation osseuse symétrique

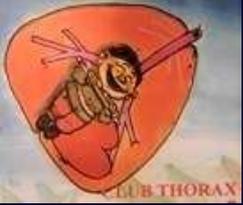

Scintigraphie osseuse Te 99m: fixation périarticulaire os longs

Atteinte thoracique → pronostic

Reins-système nerveux central

Biologie Cd68+ S100-, CD 1a-

Histiocytes « spumeux » de distribution lymphangitique

Evolution-Discussion-Point fort

Atteinte thoracique → pronostic insuffisance respiratoire
~1/2 insuffisance cardiaque

Poumons : Interstitium

épaississement des septas inter lobulaires

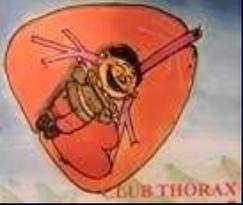

kystes aériques

Fibrose pleurale

Cœur

infiltration péricarde ° péricardite°

ischémie-valves-embolie

Références

Imagerie des localisations osseuses et extra osseuses de la maladie d'Erdheim-Chester
